New markers and linkage data

Abstract

New markers and linkage data

LINKAGE DATA

Perkins, D. D. and N.E. Murray. New
markers and linkage data.

The following mutants that were previously un-
assigned to linkage groups have now been located:

- K7 cys-4 : cysteine-4 (IV R). U V; Y8743. cf. Murray 1960.
- C124 me-9 : methionine-9 (VII). U V; Abb4 X 25a. Extracted from 44303.
Responds to methionine only (G. R. Dubes 1953), whereas me-7 responds
to cystathionine, homocysteine, or methionine. 0/341 recombinants
with me-7 (K79).
- Y154M37 ad-9 : adenine-9 (I R). X-ray; 74A. Blocked between GAR and FGAR
(N. J. Nelson and M. E. Case).
- 20705 ad(-2) : adenine (III R). X-ray; LA X La. 0/29 recombinants with
ad-2 (70004t).
- 33026 val : valine (V). U V; 1A X 19a. 0/45 recombinants with val (45201),
which is close to iv-1.
- 35001 cys-5 : cysteine-5 (I L). U V; 1A X 25a. Both 35001 and cys (85518)
respond to sulfite, and N. H. Horowitz (unpublished) had previously
shown that cys (85518) is linked to mating type. 0/111 recombinants
from an intercross of 35001 X 85518.
- T (III; VI) 1: First translocation between III and VI. Recovered by
P. St. Lawrence from a cross 74A X rg cr a; apparently spontaneous.
- 47904 T (V; VI), inos. Translocation between V and VI, not separated from
inos requirement allelic with inos (V). (N. H. Giles, 1951)

hist (PI43h) was reported as a possible second hist-4 allele (Murray and Glassey, NN. #1). Recent data confirm a location distal to pan-1. Chromatographic studies of the accumulation products of single and double mutants show that PI43h differs from hist-4 (C14l) only in that it is temperature sensitive. At 25° PI43h is not stimulated by histidine and no imidazole accumulation products were detected; at 34° PI43h is leaky but the imidazole products accumulated were characteristic of the hist-4 allele, C14l.

Three-point data are tabulated on the following page using the conventions of Perkins et al. (1962,
Canad. J. Genet. Cytol. 4:192; 1959, Genetics 44:1191). Cross numbers prefixed S designate data of the
second author.

Cross No.	Zygote Genotype and Recombination %	Parental Combinations	Recombinations			Total; per cent Germi-nation; Link-age Groups	Marker Isolation Numbers
