The purpose of this study was to determine the relationship of students' attitude toward evaluation of a modular program in Foundations of Education sponsored by the College of Education of the University of Maine at Orono, Maine.

Student evaluation of faculty performance

by Robert V. Supple

Student evaluation of faculty performance and, in truth, any type of evaluation in any area of endeavor has been an item of great controversy. In a great majority of the situations, if not all of the situations, evaluation has been considered to be an impossible and undesired activity. However, on the collegiate level, student evaluation of both program and faculty increasingly is becoming an integral part of college and university policy (Zuckerman et al. 1978). These evaluations are employed not only to aid faculty improve their teaching and to evaluate programs but also to provide the bases upon which administrators may make decisions on promotion and tenure.

Previous studies have located and identified a number of variables which should be considered when assessing student ratings of instruction. The more salient variables to be assessed are grade point average (Levin 1976), gender (Marini and Greenberger 1978), college class (Cohen and Berger 1970) and time of evaluation (Hyman 1974). In surveying specific programs offered by the faculty of the College of Education, University of Maine, Drummond (1977) also demonstrated that there are differences in ratings by level of preparation. College students preparing for teaching in primary grades, middle grades, junior high school or high school tend to rate the same course experiences differently and by different standards.

A very limited number of studies have been completed on how students feel about the concept of evaluation. Costin, Greenough and Mengas (1971) employed a nine item scale to assess attitudes toward evaluation. Their study found no significant correlation between the student's responses to items and grade point average nor between their responses and college year. They concluded that students do not equate teaching with entertainment, are not deliberately easy on teachers, rate independently of gossip, tended not to think ratings were a waste of time and were willing to spend time outside of class to make such ratings. Costin, et al, suggests that additional research be undertaken employing the variable of students' attitude toward evaluation. The purpose of the cited study was to determine the relationship of students' attitude toward evaluation of a modular program in Foundations of Education sponsored by the College of Education of the University of Maine at Orono, Maine.

Method

A 71-item questionnaire eliciting attitudes toward the modular program, attitudes toward student evaluation of faculty, methods of instruction, and evaluation of their current modular instructor was administered at the end of the third modular period in the spring session of 1977. A random sample of 86 or one-third of the students enrolled in a module identified as relating to the teaching process were selected for the study and completed the questionnaire anonymously (Fox et al. 1966). Thirty-six percent were male and 64 percent were female. Thirty-nine percent were enrolled in the College of Education, 36 percent from the College of Arts and Sciences, and 22 percent from the College of Life Sciences and Agriculture. Forty-nine percent intended to teach in the elementary school; and, 51 percent intended to teach in the secondary school. Forty-seven percent were seniors, 29 percent juniors, 19 percent sophomores, and 5 percent unclassified. The scores on the attitude items toward evaluation were summed and the groups were divided into three groups (Fianagan 1959). The groups were the upper quartile, the middle range and the lower quartile, and crosstabs ran on the item responses of the attitude toward evaluation scale.

Results

Table 1 shows the distribution of responses for the items dealing with attitudes toward evaluation. Only slightly over a quarter of the students felt their ratings would affect the professors' future teaching performance (Thurston 1978). Approximately 12 percent agreed that their ratings would affect the professors' departmental status or advancement. A quarter of the students viewed ratings as a waste of time although two-fifths of them would be willing to spend time outside of class to rate courses. Fifteen percent reported they rated a professor higher than he deserved since there are so few professors who excel at teaching. Approximately 50 percent of the group agreed to some extent that they rated the modular approach higher since they would desire to see more experimentation and innovation taking place in the College of Education. About a third thought their ratings corresponded with those of the rest of the class.

Analysis of the crosstabs by attitude toward evaluation identified those of the items other than those dealing with the evaluating scale as having significant chi squares. There were differences in the group according to reported grade point averages of the respondents (x²
educational considerations/spring 1979

discussion

The study tends to support some of the findings of Costin, Greenough and Menges (1971) relating to the students’ attitudes toward evaluations. Students in both cases felt that their ratings would have little effect on the teachers’ departmental status or advancement (Randhawa et al., 1973). They both also indicate students believe the notion that they are “easy” in rating their instructors. About the same percentage of students in both studies reported they would be willing to spend time outside of class to rate instructors.

Fewer modular students feel that their ratings will affect the professors’ future teaching performance than the University of Illinois group and were less positive in general toward rating.

There were indications that there was a relationship between grade point average and attitude toward ratings.

The results also indicate that in evaluating the attitude of students toward a new program in a department the Hawthorne effect might tend to inflate the positive response to the program (Slavin, 1977). Students with more positive attitudes toward student evaluation of instruction tended to be more supportive of the modular approach, those least positive of the standard semester approach.

Partly the differences may reflect the type of institution, the program of studies, as well as the type of students.

Additional research should be conducted investigating attitude of student evaluation of faculty in other institutions and contexts. If a student evaluation of instruction is to be effective, however, students will have to feel that their ratings are meaningful and not a waste of time.
