Sources of Roughage and Milo for Finishing Steers
J. G. Riley, K. K. Bolsen, and G. Fink

Summary

We used 75 yearling steers in a 92-day trial to evaluate three sources of roughage: (1) chopped prairie hay; (2) milo stover silage; and (3) milo stover pellets; and five milo treatments: (1) dry, 85.5% dry matter (DM); (2) field harvested, high moisture (F-HM), 72.6% DM, ensiled in an O₂-limiting structure; (3) F-HM, 79.5% DM, treated with 1.75% ammonium isobutyrate on a wet basis and stored in a metal bin; (4) F-HM, 73.6% DM, rolled and ensiled in a 10 ft. x 50 ft. concrete stave silo; and (5) harvested at 85.5% DM and reconstituted to 73.3% DM, rolled and ensiled in a 10 ft. x 50 ft. concrete stave silo.

Neither performance or carcass characteristic differences could be attributed to source of roughage when it was fed at 15% of the ration dry matter, which indicates that milo stover can be effectively used in finishing rations.

Steers fed high-moisture milo treated with AIB or stored in an O₂-limiting structure performed similarly and gained faster (P<.05) and more efficiently (P<.05) than steers fed dry milo.

Introduction

The high cost of typical roughages and grains fed to cattle has created a need for information on the acceptability of crop residues as roughage in finishing rations and additional up-to-date performance data on selected sources of milo available to Kansas cattle feeders. Previous research at KSU, including articles in this publication, has shown milo stover to be most beneficial in rations for nonlactating beef cows and to be less beneficial in wintering rations for growing beef heifers.

In this trial we evaluated milo stover (silage or pellets) as a roughage source and compared five typical milo sources in steer finishing rations.

Experimental Procedure

We allotted 75 crossbred yearling steers averaging 812 lbs. by weight to 15 pens of five steers each. Five pens were assigned to each of the three sources of roughage: (1) chopped prairie hay; (2) milo stover silage; (3) milo stover pellets; and five milo treatments: (1) dry, 85.5% dry matter (DM); (2) field harvested, high moisture (F-HM), 72.6% DM, ensiled in an O₂-limiting structure; (3) F-HM, 79.5% DM, treated with 1.75% ammonium isobutyrate on a wet basis and stored in a metal bin; (4) F-HM, 73.6% DM, rolled and ensiled in a 10 ft. x 50 ft. concrete stave silo; and (5) harvested at 85.5% DM and reconstituted to 73.3% DM, rolled and ensiled in a 10 ft. x 50 ft. concrete stave silo.

Neither performance or carcass characteristic differences could be attributed to source of roughage when it was fed at 15% of the ration dry matter, which indicates that milo stover can be effectively used in finishing rations.

Steers fed high-moisture milo treated with AIB or stored in an O₂-limiting structure performed similarly and gained faster (P<.05) and more efficiently (P<.05) than steers fed dry milo.

Neither performance or carcass characteristic differences could be attributed to source of roughage when it was fed at 15% of the ration dry matter, which indicates that milo stover can be effectively used in finishing rations.

Steers fed high-moisture milo treated with AIB or stored in an O₂-limiting structure performed similarly and gained faster (P<.05) and more efficiently (P<.05) than steers fed dry milo.

Introduction

The high cost of typical roughages and grains fed to cattle has created a need for information on the acceptability of crop residues as roughage in finishing rations and additional up-to-date performance data on selected sources of milo available to Kansas cattle feeders. Previous research at KSU, including articles in this publication, has shown milo stover to be most beneficial in rations for nonlactating beef cows and to be less beneficial in wintering rations for growing beef heifers.

In this trial we evaluated milo stover (silage or pellets) as a roughage source and compared five typical milo sources in steer finishing rations.
and (3) milo stover pellets. One pen from each roughage source was assigned to each of the five sources of milo: (1) dry, 85.5% dry matter (DM); (2) field harvested, high moisture (F-HM), 72.6% DM, ensiled in an O₂-limiting structure; (3) F-HM, 79.5% DM, treated with 1.75% ammonium-isobutyrate on a wet basis and stored in a metal bin; (4) F-HM, 73.6% DM, rolled and ensiled in a 10 ft. x 50 ft. concrete stave silo; and (5) harvested at 85.5% DM and reconstituted to 73.3% DM, rolled and ensiled in a 10 ft. x 50 ft. concrete stave silo. Milo in treatments 1, 2, and 3 was rolled before being fed.

The trial was 92 days (February 7 to May 10, 1974). All rations contained 80% of the specific milo, 15% roughage and 5% supplement on a dry matter basis. All contained equal crude protein and non-protein nitrogen. All were mixed and fed free choice twice daily. Individual initial and final weights were taken after steers had been 15 hours without access to feed or water. Performance data were adjusted to a constant dressing percentage basis. Individual slaughter and carcass data were obtained at Wilson and Co., Kansas City, Missouri,

**Results and Discussion**

Effects of roughage sources on feedlot performance of steers are shown in table 14.1. Differences were not significant; however, steers fed milo stover silage gained slower and were the least efficient. Steers consuming milo stover pellets consumed less daily feed and were the most efficient.

Effects of milo sources on feedlot performance are given in table 14.2. Steers fed field harvested, high-moisture milo treated with AIB and those fed milo stored in an O₂-limiting structure performed similarly and gained faster (P<.05) than steers fed dry milo, and were more efficient (P<.05) than steers fed dry milo or either of the two high moisture milos stored in concrete stave silos. Steers fed the dry-rolled milo gained 17% slower and 22% less efficiently than steers fed milo from an O₂-limiting structure. High-moisture silos produced higher daily gains than dry milo did, but the high-moisture milos produced gains approximately 6% slower and 18% less efficiently than milo stored in the O₂-limiting structure.

Effects of milo sources on carcass characteristics are shown in table 14.3. None of the carcass characteristics measured differed significantly.
