Effects of Supplementation with Corn or Dried Distillers Grains on Gains of Heifer Calves Grazing Smooth Bromegrass Pastures

Abstract
Thirty heifer calves grazing smooth bromegrass pastures were used to compare supplementation with 0.5% of body weight per head daily of corn or dried distillers grains (DDG). Daily gains of heifers supplemented with corn or DDG were similar ($P > 0.05$).

Effects of Supplementation with Corn or Dried Distillers Grains on Gains of Heifer Calves Grazing Smooth Bromegrass Pastures

L.W. Lomas and J.L. Moyer

Summary
Thirty heifer calves grazing smooth bromegrass pastures were used to compare supplementation with 0.5% of body weight per head daily of corn or dried distillers grains (DDG). Daily gains of heifers supplemented with corn or DDG were similar ($P > 0.05$).

Introduction
Distillers grains, a byproduct of the ethanol industry, have tremendous potential as an economical and nutritious supplement for grazing cattle. Distillers grains contain a high concentration of protein (25 to 30%), with more than two-thirds escaping degradation in the rumen, which makes it an excellent supplement for younger cattle. Recent advancements in the ethanol manufacturing process have resulted in extraction of a greater amount of fat resulting in distillers grains that may contain less energy than corn. This research was conducted to compare performance of stocker cattle supplemented with corn or DDG at 0.5% body weight per head daily while grazing smooth bromegrass pastures.

Experimental Procedures
Thirty heifer calves (420 lb) were weighed on two consecutive days, stratified by weight, and randomly allotted to six 5-acre smooth bromegrass pastures on April 8, 2014. Three pastures of heifers were randomly assigned to one of two supplementation treatments (three replicates per treatment) and grazed for 142 days. Supplementation treatments were ground corn or DDG at 0.5% body weight per head daily. DDG used in this study contained 25% protein and 6% fat. Pastures were fertilized with 100 lb/a nitrogen and $P_2O_5$ and $K_2O$ as required by soil test on February 21, 2014. Pastures were stocked with 1 heifer/a and grazed continuously until August 28, 2014, when heifers were weighed on two consecutive days and grazing was terminated.

Cattle in each pasture were group-fed corn or DDG in meal form in bunks on a daily basis, and pasture was the experimental unit. No implants or feed additives were used. Weight gain was the primary measurement. Cattle were weighed every 28 days; quantity of supplement fed was adjusted at that time. Cattle were treated for internal and external parasites before being turned out to pasture and later vaccinated for protection.
from pinkeye. Heifers had free access to commercial mineral blocks that contained 12% calcium, 12% phosphorus, and 12% salt.

**Results and Discussion**

Cattle gains and supplement intake are presented in Table 1. Daily gains and average daily supplement intake were 2.00 and 2.8 lb per head daily and 2.10 and 2.9 lb per head daily for heifers supplemented with corn and DDG, respectively. Gains and supplement intake of heifers supplemented with corn were similar ($P > 0.05$) to those of heifers that were supplemented with DDG. This result suggests that protein did not limit performance of heifers grazing these pastures because heifers fed corn received a similar amount of supplemental energy but less supplemental protein than those fed DDG.

The results indicate that the supplementation strategy did not significantly affect the growth rate of the heifers, suggesting that the amount of supplemental energy provided was sufficient to support their growth needs, while the protein content in DDG was adequate for their dietary requirements. The slight difference in gain and supplement intake between the two groups suggests a slight advantage in favor of the DDG group, possibly due to the higher protein content in DDG. Further studies could investigate the long-term effects of such supplementation strategies on the health and productivity of heifers grazing smooth bromegrass pastures.
